Warning: Lots of possible types!!!!!!!!!!!!!!

1 Day I: Overall Discussion and Classical Mechanics

1.1 Actions and Path Integrals

Action $S : \mathcal{E} \rightarrow \mathbb{R}$ where \mathcal{E} always has infinite dimension, and \mathbb{R} is a field (usually \mathbb{R} or \mathbb{C}).

QM in Imaginary Time $\xrightarrow{\text{Brownian Motion}}$ Wiener Measure on Phase Space

Asymptotic Analysis \rightarrow Perturbative Renormalisation Theory

Example 1.1. *Some Examples of Classical Field Theories*

- (a) *Scalar Field Theory* $\mathcal{E} = C^\infty(X)$
- (b) *Gauge Theory* $\mathcal{E} = \text{Conn}(P, X)$
- (c) *σ Model* $\mathcal{E} = \text{Maps}(\Sigma, X)$
- (d) *Gravity* $\mathcal{E} = \text{Metrics}(X)$ (More better descriptions does not depends on the background)

1.2 Observables

Observables are functions on the space of fields, i.e. $\mathcal{O} \in C^\infty(\mathcal{E})$.

Example 1.2 (field theory). (a) Consider $X = pt$, thus $\mathcal{E} = \mathbb{R}^n$ for example.

(b) $\dim X > 0$, the new algebraic structure arise form topological structures of X .

The Key Point is: Capture the data of open sets of $X \rightarrow$ Consider the observables supported on open set U of X denoted by $\text{Obs}(U)$ where U is an open set of X .

Local data captures the open sets of X . The relations between open sets captures the global data of $X \rightarrow$ The algebraic structure of the observables is a sheaf of X .

$$\bigsqcup_i U_i \rightarrow \bigotimes_i \text{Obs}(U_i)$$

Which implies OPE in physics and factorization algebra in mathematics.

Higher product in QFT: The generalization of products of algebra ('products in any direction instead of left and right') e.g. QM gives only left and right module of an algebra; OPE has products in various directions.

Consider the $\dim X = 2$ case in detailed

Example 1.3 (Holomorphic/Chiral Field Theory). *Various angle of product $A(w)B(z)$ could be denoted by the time of $A(w)$ rotations around $B(z)$, which could be captured by the Fourier mode of $A(w)$, thus one can have*

$$A(w)B(z) = \sum_{m \in \mathbb{Z}} \frac{(A_{(m)}B(z))}{(z-w)^{m+1}}$$

which is the Chiral algebra due to Beilinson and Drinfeld and generalized by Gui
